- DGF is located in Poland and it is the only company on the market which offers the opportunity to purchase smart Glass fully manufactured in Poland. Our service meets the needs of your home or office.
- DGF smart glass can be transparent like a traditional window or it can get blurred and darker. Our smart glass may be divided into moduls fully created and invented by us. You may darken the window only partially which allows you to create an effect of a non-transparent window.
- The configuration of darkening the glass and on the other hand, brightening it from the darker mode is always up to you and can be adjusted to your needs.

- The Digi Glass Factory product not only is dedicated to people who appreciate comfort and design but also to those who support environmentally friendly solutions. DGF glass has insulation properties along with thermal and acoustic ones which allows to maintain stable room temperature and additionally protects the interior against noises from the outside.
- We are constantly working on improving our products. Power needed for 1 m2 glass is only 1 W. (comparable to a small LED bulb) It allows to supply Power through photovoltaic cells. As a result, it is energy sufficient and other sources of energy are not needed here.

- An additional solution which we're planning to introduce in the foreseeable future is an automatic system making windows darken which depends on the intensiveness of light.
- DGF Glass is powered by low voltage of 48V, making it 100% safe while being used in bathrooms.

- Our solution allows to darken all the window's surface as well as its selected areas. Its additional advantage is the controllability while using the pilot and the mobile application.
- The glass has the option for displaying the rotated projection thus it can be a great solution for showing advertisements.

Using DGF glass you decide when and how much light to let into the room
